

# BENEFIT CONSULTANTS

## WHAT IS HEALTH RISK MONITOR

Health Risk Monitor (HRM) is a software solution that provides accurate clinical predictions of each patient's health and cost in the next 12 months. The system provides actionable information to enhance revenue and reduce client costs and risks. HRM doesn't just look at members who were high-cost last year but identifies future high-cost members. We can't change the dollars spent last year, but with our solution, benefit consultants can focus on the cost saving opportunities and programs for next year.

## DATA INTEGRATION

HCRM will eliminate the task of integrating, scrubbing, and manipulating data. We collect data from your clients' vendors, including medical and pharmacy claims, eligibility, and lab data. To simplify and speed up the process, we accept data in standard layouts already used by each vendor. HCRM personnel validate and normalize the data with extensive quality control. The data are collected monthly, allowing you to access the latest information on your clients' costs and risks.

### Member Centric

HCRM's predictive model is known for its accuracy as it makes predictions at the member level. Our model predicts future high-cost members based on total risk and categorizes them based on clinical risk drivers such as diabetes and hypertension. HRM provides you with the advantage of knowing what your client is facing next year and the reason behind the forecasted cost and risk of each member. Now, you can determine aggregate attachment points and specific deductibles at group and member levels.

## REPORTING CAPABILITIES

1

HRM allows benefit consultants to quickly and accurately identify and stratify their population into cohorts of interest and allow you to assess the effectiveness of care management programs implemented by plan vendors.

2

HRM generates standard reports with the data in a graphical form, including group-level reporting and member-level detail, enabling in-depth renewal planning and analysis.

3

Standardized reports will identify where your clients should focus their efforts in managing the health plan's cost and risk, look at clinical and financial outcomes and compare the results based on member participation and in relation to national and regional data.
