

HEALTH MANAGEMENT VENDORS

WHAT IS HEALTH RISK MONITOR

Health Risk Monitor (HRM) provides an end-to-end solution from predictive data aggregation to risk profiling and care management workflows, everything needed to improve patient outcomes right at your fingertips from a single system. This enables users to identify, stratify, and manage health conditions within a given population. HRM doesn't just look at members who were high-cost last year but identifies future high-cost members based on their current clinical condition, including gaps in care and the likely outcomes of that data. With this solution, you can identify appropriate interventions to improve member health and reduce your clients' cost and risk in the next year.

DATA INTEGRATION

HCRM eliminates the task of integrating, scrubbing, and manipulating data. We collect data from your clients' vendors, including medical and pharmacy claims, eligibility, and lab. HCRM personnel validate and normalize the data with extensive quality control. The data are collected every month so that you may have access to the most current information about your clients' cost and risk.

Member Centric

Members are identified by forecasted dollars which are broken down into individual clinical risk drivers including:

- Current conditions or diagnosis driving cost
- Medications and compliance in taking them
- Likelihood of being in acute care
- Compliance with standards of care
- Tracking standards for 19 chronic conditions and four preventive categories
- The member's motivation to maintain or improve healthy behaviors

REPORTING CAPABILITIES

Schedule and track calls and outreach efforts

Time documentation and patient notes

Create customized care plans for coaches/nurses and track program performance

Understand your member's ability to respond to care plans and measure individual progress

Assign "outreach" requests based on forecasted risk identification

Allocate resources more efficiently and tailor outreach
